MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:36:11 1999; MasPar time 2.45 Seconds 172.800 Million cell updates/sec

Tabular output not generated.

Title: Description: Perfect Score: >US-08-991-628-5 (1-15) from US08991628.pep 113

Sequence: 1 CECNIKVKDVNDNFP 15

Scoring table: PAM 150 Gap 15

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 l:swissprot

Statistics: Mean 26.658; Variance 31.710; scale 0.841

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NATL. ACAD. SCI. U.S.A. 88:4796-4800(1991).
FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS.
INVOLVED IN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEDIFILAMENTS MEDIATING CELL-CELL ADHESION.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: EPIDERMIS, TONGUE, TONSILAND OESOPHAGUS.
DOMAIN: CALCIUM MAY BE BOUND BY THE CADHERIN-LIKE REPEATS

"MOUSE desmocallin (Dsc3) and desmoglein (Dsg1) genes are closely
linked in the proximal region of chromosome 18.";

GENOMICS 21:510-516(1994).

-i- FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS. INVOLVE
IN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEDIATE FILAMENTS
MEDIATING CELL-CELL ADHESION. MAY CONTRIBUTE TO EPIDERMAL CELL
POSITIONING (STRATIFICATION) BY MEDIATING DIFFERENTIAL
ADHESIVENESS BETWEEN CELLS THAT EXPRESS DIFFERENT ISOFORMS.
-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-I- TISSUE SPECIFICITY: IN ALL EPITHELIA TESTED AND HEART.
-I- DOMAIN: CALCIUM MAY BE BOUND BY THE CADHERIN-LIKE REPEATS
                                                                                                                               modified and this statement is not removed entities requires a license agreement (See or send an email to license@isb-sib.ch).

-!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

-!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

-!- THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGRINGOUS CELL TYPES. THIS CADHERIN MAY PLAY A IMPORTANT ROLE IN ENDOTHELLAL TYPES. THIS CADHERIN MAY PLAY A IMPORTANT ROLE IN ENDOTHELLA TYPES. THIS CADHERIN FOR THE CYTOSKELETON.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. FOUND AT CELL-CELL BOUNDARIES AND PROBABLY AT CELL-MATRIX BOUNDARIES.

-!- TISSUE SPECIFICITY: ENDOTHELIAL TISSUES AND BRAIN.

-!- SIMILARITY: BELONGS TO THE CADHERIN FORMILY.

-!- FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS. INVOLIN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEDIATE FILAMENT MEDIATING CELL-CELL ADHESION. MAY CONTRIBUTE TO EPIDERWAL CELL POSITIONING (STRATIFICATION) BY MEDIATING DIFFERENTIAL ADHESIVENESS BETWEEN CELLS THAT EXPRESS DIFFERENT ISOFORMS.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

Statistics: Mean 25.706; Variance 33.200; scale 0.774

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- THIS PROTEIN CONTAINS SEVERAL REPEATED FERREDOXIN-LIKE DOMAINS.
-!- COFACTOR: BINDS TEN 4FE-48 CLUSTER.
-!- SUBUNIT: VHU CONSISTS OF THE VHUA, VHUG, VHUU SUBUNTS AND A FERREDOXIN PROTEIN.

ALIGNMENTS

derived from th polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein 3 protein (amino acids 512-526) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in W04841-47. Claim 1; Page 41; 58pp; English.

Claim 1; Page 41; 58pp; English.

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid polypeptide (whether self or non-self) includes an amino acid Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in Strominger JL, WW WPI, 96-425218/42 12-SEP-1996. 07-MAR-1996; U03182. 07-MAR-1995; US-400796. W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgGl hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                               DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; 50pp; English. This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R30742

Disclosure, Fig 49; 209p; English. The proteins derived from the nematode DNA may be used vaccines against parasitic infection of plants, humans esp. sheep. MAbs may also be raised to provide passive prophylaxis against infection.

                                                                                                                                                                                           mouse heart library. Recombinant mCRF-RBI can be expressed in host cells transformed by the CDNA clone. The receptor can be to identify agonists and antagonists that modulate the signal transduction activity mediated by CRF receptors. It may be administered therapeutically to reduce high ACTH levels caused

                                                                                                                                                                                                                                                                                  The synthetic gene encodes a protein corresponding to an antibody capable of binding to a specific antigen, in this case the HIV-1 tat protein. Many synthetic genes are synthesised, each containing a predetermined nucleotide region encoding the framework regions of the heavy and light chains of antibody and undetermined nucleotide regions which are random sequences. The genes are then used in the construction of vectors which are subsequently used to transform microbes. The proteins thus produced are screened for binding activity to the specific antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R40924

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, haemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the degree of variation in gene expression, and particularly does not disrupt
                                                                                                                                                                                                                                                                                                                                                                T 10

Claim 7; Page -; 98pp; English.

The present sequence is a specific example of a chimeric integrase made up of three domains from MoMLV and Ty3, with at least one domain derived from Ty3 integrase. This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, haemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild-type degree of variation in gene expression, and particularly does not disrupt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (R90575) is a membrane-bound G-coupled protein receptor involved in signal transduction. It can be produced by expression of encoding cDNA (T12244) in procaryotic or eucaryotic host cells. Recombinant CRF2 receptor is used to screen CRF2 receptor agonists and antagonists of therapeutic appln., and to prepare antibodies which specifically bind to CRF2 receptors.

This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, hemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the

CC The present sequence is the light chain variable region of the great the sequence is the light chain variable region of the present sequence is the light chain variable region of the grant human Fas ligand monoclonal antibody (WAB) NOK-5 NOK-5 is produced by the hybridoma NOK-5 (FERM BP-5048), which was prepared by immunising mice with transformed human Fas ligand expressing COS cells, and fusing spleen cells isolated from the mice with myeloma P3x63Ag8 653 (ATCC CRL-1580) cells. The MAB recognises the human CC Fas ligand on the cell surface or in solution, and can be used to inhibit the apoptosis inducing cell surface Fas ligand/Fas reaction. The MAB can also be used for a Fas ligand assay in CC biological samples (e.g. human blood), especially for disease CC diagnosis, e.g. hepatitis, infectious mononucleosis and systemic CC lupus erythematosis.

Anti-human Fas Ligand antibody to treat hepatitis - controls apoptosis in liver cells and improves liver function Claim 6; Page 41; 51pp; Japanese.

The present sequence is the light chain variable region of the murine anti-human Fas ligand (FasL) monoclonal antibody (MAb) NOK5, which is expressed by the hybridoma NOK5 (FERM BP-5044). The MAb can be used in the preparation of a composition for the effective oral or parenteral treatment of hepatitis, including hepatitis caused by hepatitits B or C virus. The composition controls apoptosis in liver cells caused by the binding of FasL to Fas expressing liver cells, and improves liver function by improving blood glutamate oxaloacetate and pyruvate transaminase levels. The composition is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-JAN-1998 (first entry)

Title: Description: Perfect Score: Sequence: >US-08-991-628-6 (1-15) from US08991628.pep 109 1 SARTLNNRYTGPYTF 15

Scoring table: PAM 150 Gap 15

Searched: 122810 segs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir60 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 26.619; Variance 37.654; scale 0.707

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The order of association in the morphogenesis pathway is strictly determined except for gp 11 which can be added at any stage of the pathway. Gp 8 associates to the precursor structure after gp 7 binding and before gp 6 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene 8 is directed clockwise in the T4 map;
gene 8 overlaps with the 3'-end of gene 7
